Claim 15 (original): The track device of claim 14, wherein said tongue is provided with a hooking element projecting therefrom, and said track base of said first member has a strip portion having a front and rear opposed faces, said front face providing an edge for engaging said hooking element to prevent longitudinal displacement of said first member with respect to said second member, said rear face sloping to facilitate insertion of said tongue into said socket.

10

Claim 16 (original): A merchandising track device for displaying articles, said track device comprising an elongate body having a forward end, said body comprising a track base for carrying a row of articles in sliding movement along said body, a tongue extending forwardly from said track base and defining said forward end of said body, and at least one article guiding side wall upstanding from said track base and extending along said body; and

a front piece formed as a discrete structure separate from said body and attached to said forward end of said body to provide a stopper for preventing a leading article in said row from exiting said track device, said front piece comprising a deck for supporting said leading article, said deck having a socket for receiving said tongue so that said deck and said track base are interconnected, said tongue being formed on said track base such that an upper surface of said tongue is disposed below an upper surface of said track base to allow said upper surface of said track base and an upper surface of said

deck to form a continuous floor for slidably supporting
said articles, at least one upright wall upstanding from
said deck and disposed in general longitudinal alignment
with said one side wall, said one upright wall including a
15 portion extending upwardly above an upper edge of said
sidewall; and locking means integrally formed with said
front piece for interconnecting said one upright wall
said one side wall to lock said front piece in position
relative to said body, said locking means including a
20 flexible overhang extending rearward from said portion of
said one upright wall and disposed over said upper edge of
said one side wall having said cutout, said flexible
overhang flexing to either side of said one side wall
said second member; and
25 a pair of engaging tabs disposed respectively
alongside opposite side surfaces of said one side wall
cutout with at least one of said engaging tabs being
integrally formed with said overhang so that lateral
displacement of said one upright wall relative to said
30 side wall is prevented.

Claim 17 (original): The track device according to
claim 16, wherein said tongue is provided with a hooking
element projecting therefrom, and said deck has a strip
portion having front and rear opposed faces, said front
5 face providing an edge for engaging said hooking element
to prevent forward displacement of said front piece with
respect to said body, said rear face sloping to facilitate
insertion of said tongue into said socket.

Claims 18-24 (cancelled).

Claim 25 (previously presented): A merchandising display track device assembly for a merchandising display track device, said track device being adapted to receive a row of articles for sliding movement therealong, said front panel assembly comprising:

a base adapted to receive said row of articles in said track device for sliding movement therealong;

a first upstanding vertical member having a top end portion, a bottom end portion and a front edge, said first vertical member being permanently connected along its bottom end portion to said base;

a first face member connected to said front edge of said first vertical member, said first face member extending laterally a preselected distance from said first vertical member toward said second vertical member;

a second upstanding vertical member having a top end portion, a bottom end portion and a front edge, said second vertical member being laterally spaced from said first vertical member and permanently connected along its bottom end portion to said base;

a second face member connected to said front edge of said second vertical member, said second face member extending laterally a preselected distance from said second vertical member toward said first vertical member;

an elongate connecting member having a first end portion connected to said top end portion of said first vertical member and a second end portion connected to said top end portion of said second vertical member, said connecting member curving outwardly away from said vertical members; and

means for detachably attaching said front panel assembly to said track device.

Claim 26 (previously presented): A front panel assembly as set forth in claim 25, wherein said first and second face members are connected to said base.

Claim 27 (previously presented): A front panel assembly for a merchandising display track device, said track device having a track base adapted to receive a row of articles for sliding movement therealong and a vertical member extending along said track base, said vertical member having a cutout opening to an upper edge thereof and to opposite side surfaces thereof, said front panel assembly, comprising:

a floor deck adapted to receive said row of articles from said track base for sliding movement therealong;

means for detachably attaching said floor deck to said track base;

a first upstanding vertical member having a top end, a bottom end portion and a front edge, said first vertical member being permanently connected along its bottom end portion to said floor deck;

a second upstanding vertical member having a top end, a bottom end portion and a front edge, said second vertical member being laterally spaced from said first vertical member and permanently connected along its bottom end portion to said floor deck;

an elongate connecting member having a first end connected to said top end of said first vertical member and a second end portion connected to said top end of said

25 second vertical member, said connecting member extending
outwardly away from said vertical members;

locking means integrally formed with one of said
first and second vertical members for interconnecting the
vertical member of said track device and said one vertical
30 member to lock said vertical members in position relative
to each other, said locking means comprising a flexible
overhang extending rearward from said one vertical member
and adapted to be disposed over said cutout so that said
flexible overhang engages a side of said vertical member of
35 said track device with a lug formed integrally with said
flexible overhang and received in said cutout thereby
preventing longitudinal displacement of said front panel
assembly relative to said track; and

a pair of engaging tabs disposed respectively
40 alongside said opposite side surfaces of said vertical
member of said track device with at least one of said of
said engaging tabs formed on said lug so that lateral
displacement of said one vertical member relative to said
track device is prevented.

45

Claim 29 (New): A front panel assembly for
merchandising display track device, said track device being
adapted to receive rows of articles for sliding movement
therealong, said front panel assembly, comprising:

5 a base adapted to receive said rows of articles for
said track device for sliding movement therealong;

a first upstanding vertical member having a top end
portion, a bottom end portion and a front edge, said first
vertical member being permanently connected along its
10 bottom end portion to said base;

a second upstanding vertical member having a top end portion, a bottom end portion and a front edge, said second vertical member being laterally spaced from said first vertical member and permanently connected along its bottom end portion to said base;

a third upstanding vertical member having a top end portion, a bottom end portion and a front edge, said third vertical member being laterally spaced from said second vertical member and permanently connected along its bottom end portion to said base, said second vertical member being intermediate said first and third vertical members;

a first face member having a top end portion and bottom end portion and being connected to said front edge of said first vertical member, said first face member extending laterally a preselected distance from said first vertical member toward said second vertical member;

a second face member having a top end portion and bottom end portion and being connected to said front edge of said second vertical member, said second face member extending laterally a preselected distance from said second vertical member toward said first vertical member and extending laterally a preselected distance from said second vertical member toward said third vertical member; and

a third face member having a top end portion and bottom end portion and being connected to said front edge of said third vertical member, said third face member extending laterally a preselected distance from said third vertical member toward said second vertical member;

a first elongate connecting member having a first end connected to said top end portion of said first vertical member and a second end portion connected to said

top end portion of said second vertical member, said first
connecting member curving outward away from said first and
second vertical members;

45 a second elongate connecting member having a first
end connected to said top end portion of said second
vertical member and a second end portion connected to the
top end portion of said third vertical member, said second
connecting member curving outward away from said second and
50 third vertical members; and

means for detachably attaching said front panel
assembly to said track device.

Claim 30 (New): A front panel, as set forth
in claim 29, wherein said first, second and third face
members are connected to said base.
